

Africa Weather Hazards Assessment

- 1) Heavy rains are likely to continue in this region

NOTE: Cross hatching regions depict combined wheat, maize, sorghum, and millet crop zones which are active (sowing to harvest) during the current month. (from FAO)

- 2) Hydrological dryness persists

- 3) Drought continues throughout the region

- 4) Reservoir levels remain low throughout the country

- 5) Short-term drought continues to negatively affect the region; little rain is forecast over the next week

- 6) Saturated soil throughout the region; additional rain could lead to isolated flooding
